< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Many of the most active areas of statistical research involve large sparse data problems where the number of variables and/or parameters is large, especially relative to the number of independent obser vations.
- Standard statistical theory for estimation and results related to asymptotic behavior often fail in such settings.
- The computational tools associated with algebraic statistics are useful often only for low-dimensional problems, e.g., involving a small number of parameters.
- Upshot: algebraic statistical and the related computational tools can nonetheless provide important insights of value in large sparse contingency table and network settings.

## Example: Monks in a monastery

- ▶ 18 novices observed over two years.
- Network data gathered at 4 time points; and on multiple relationships.

See analyses in Airoldi, Blei, Fienberg, Xing. (2008) Mixed membership stochastic block models. J. of Machine Learning Research.

# Example: The Collective Dynamics of Smoking in a Large Social Network (James Fowler)

Node border= gender (red=female, blue=male). Arrow color = relation (purple=friend, green=spouse). Node color = smoking behavior (white=nonsmoker, gray=smoker); darker shades = more cigarettes consumed per day.

# The $p_1$ random graph model (Holland-Leinhardt)

▶ *n* nodes, random occurrence of directed edges.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

The  $p_1$  random graph model (Holland-Leinhardt)

- n nodes, random occurrence of directed edges.
- Describe the probability of an edge occurring between nodes i and j:

$$\begin{split} & \log \operatorname{Prob}(\operatorname{no}\,\operatorname{edge}) = \lambda_{ij} \\ & \log \operatorname{Prob}(\operatorname{from}\,i\,\operatorname{to}\,j) = \lambda_{ij} + \alpha_i + \beta_j + \theta \\ & \log \operatorname{Prob}(\operatorname{from}\,j\,\operatorname{to}\,i) = \lambda_{ij} + \alpha_j + \beta_i + \theta \\ & \log \operatorname{Prob}(\operatorname{bi-directed}\,\operatorname{edge}) = \lambda_{ij} + \alpha_i + \beta_j + \alpha_j + \beta_i + 2\theta + \rho_{ij} \end{split}$$

- Parameters:
  - $\lambda_{ij}$  is a normalizing constant
  - $\alpha_i$  represents node *i* sending an edge
  - $\beta_i$  represents node *j* receiving an edge
  - $\rho_{ij}$  represents the reciprocation effect (3 common forms:

$$egin{aligned} &
ho_{ij} = 0, \ &
ho_{ij} = 
ho \ {
m constant}, \ &
ho_{ij} = 
ho + 
ho_i + 
ho_j \ {
m edge-dependent}). \end{aligned}$$

# Estimation for $p_1$

- The likelihood function for the p<sub>1</sub> model is clearly of exponential family form.
- Holland-Leinhardt explored goodness of fit of model empirically by comparing ρ<sub>ij</sub> = 0 vs.ρ<sub>ij</sub> = ρ.
- The problem is that standard asymptotics (normality and chi-squared goodness of fit tests) aren't applicable as the number of parameters increases with the number of nodes.
- Fienberg and Wasserman used the edge-dependent reciprocation model to test  $\rho_{ij} = \rho$ .
- For a review of these and related models, see: Goldenberg, Zheng, Fienberg, Airoldi. (2010) "A Survey of Statistical Network Models".

# The problem:

 Describe a Markov basis for *n*-node network for large *n*. (Describe the corresponding toric variety implicitly.)

- -

#### A classical construction:

- Edge subring of a graph *G* (or: *toric ring of G*):
- generated by the edges of the G:
- For G = K<sub>n,m</sub> with vertex sets α<sub>1</sub>,..., α<sub>n</sub> and β<sub>1</sub>,..., β<sub>n</sub>, the edge subring is the image of the map

$$p_{ij} \mapsto \alpha_i \beta_j.$$

- The defining ideal is the kernel of this map:
- ▶ an example of an element in the ideal is  $p_{12}p_{34} p_{14}p_{32}$ .

## $p_1$ model as a toric variety

► To each pair of nodes and edge type we associate a monomial in the model parameters:  $p_{12}(1,1) \mapsto \lambda_{12}\alpha_1\beta_2\alpha_2\beta_1\theta^2\rho_{12}$ represents a bi-directed edge between 1 and 2.

## $p_1$ model as a toric variety

- ► To each pair of nodes and edge type we associate a monomial in the model parameters:  $p_{12}(1,1) \mapsto \lambda_{12}\alpha_1\beta_2\alpha_2\beta_1\theta^2\rho_{12}$  represents a bi-directed edge between 1 and 2.
- ▶ The monomial map  $C[p_{ij}(a, b)] \rightarrow C[\lambda_{ij}, \alpha_i, \beta_i, \theta, \rho_{ij}]$

$$p_{ij}(a,b) \mapsto \lambda_{ij} \alpha_i^a \alpha_j^b \beta_i^b \beta_j^a \theta^{a+b} \rho_{ij}^{min(a,b)}$$

parametrizes a toric variety, whose design matrix  $A_n$  has:

- $4\binom{n}{2}$  columns (variables),
- $\binom{n}{2} + 2n + 1$  rows (parameters) if  $\rho_{ij} = 0$ ;  $2\binom{n}{2} + 2n + 2$  if  $\rho_{ij} = \rho + \rho_i + \rho_j$ .
- The kernel of the map (matrix) defines a toric ideal, whose generating set is a Markov basis (Diaconis-Sturmfels '98).
- For n = 3 and  $\rho_{ij}$  edge-dependent:
- the design matrix is a rank-11 14  $\times$  12 matrix
- the variety is a cubic hypersurface in  $\mathbb{P}^{11}$ .

## 3-node network

- Markov bases connect all networks with same sufficient statistics (in- and out- degrees of the nodes).
- ▶ For all 3 cases of  $\rho_{ij}$ , there is only one Markov move:

Figure: dashed edges are replaced by full edges.

- ▶ remove edges  $1 \rightarrow 2$ ,  $2 \rightarrow 3$  and  $3 \rightarrow 1$ replace them by edges  $2 \rightarrow 1$ ,  $3 \rightarrow 2$  and  $1 \rightarrow 3$ .
- This move is represented by the binomial:

 $p_{12}(1,0)p_{23}(1,0)p_{13}(0,1) - p_{12}(0,1)p_{23}(0,1)p_{13}(1,0).$ 

# Simplification of $p_1$ and toric ring of a graph

By ignoring normalizing constants  $\lambda_{ij}$  we get a simplified model:

Theorem (P.-Rinaldo-Fienberg)

If  $\rho_{ij} = 0$ , the ideal of the simplified model equals  $I_{G_n} + T_n$ where  $T_n$  is generated by  $p_{ij}(1,0)p_{ij}(0,1) - p_{ij}(1,1)$ and  $I_{G_n}$  is the toric ideal of the edge subring of  $G_n := K_{n,n} \setminus \{i, i\}$ .

#### Theorem (P.-Rinaldo-Fienberg)

If  $\rho_{ij} = \rho + \rho_i + \rho_j$ , the ideal of the simplified model equals  $I_{G_n} + Q_n$ where  $I_{G_n}$  is as above,

and  $Q_n$  is the toric ideal of the edge subring of  $K_n$ .

# Simplification of $p_1$ and toric ring of a graph, II

An example with 4 nodes

What is I<sub>G<sub>n</sub></sub>? Its generators have a nice description in terms of paths:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

#### Simplification of $p_1$ and toric ring of a graph, II An example with 4 nodes

#### Simplification of $p_1$ and toric ring of a graph, II An example with 4 nodes

#### Simplification of $p_1$ and toric ring of a graph, II An example with 4 nodes

Figure: the corresponding path in  $K_{4,4} \setminus \{i, i\}$ 

## Toric ideal of the $p_1$ model

• Incorporate  $\lambda_{ij}$  into the previous theorems:

## Theorem (P.-Rinaldo-Fienberg)

The toric ideal of the p1 random graph model is the multi-homogenous piece of the toric ideal of the simplified model.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

By multi-homogeneous, we mean with respect to each pair i, j.

## Toric ideal of the $p_1$ model

• Incorporate  $\lambda_{ij}$  into the previous theorems:

## Theorem (P.-Rinaldo-Fienberg)

The toric ideal of the p1 random graph model is the multi-homogenous piece of the toric ideal of the simplified model.

By multi-homogeneous, we mean with respect to each pair i, j.

We claim that homogenizing simple moves appropriately produces the whole Markov basis for the model:

#### Conjecture

Minimal Markov (Gröbner) bases for the  $p_1$  models can be obtained from Markov (Gröbner) bases of the simplified model by repeated lifting and overlapping of the binomials in the minimal Markov bases of various (n - 1)-node subnetworks.

N-fold structure of the design matrices

# Network model challenges

- How to use algebraic statistics results for (1) existence of MLEs and (2) to assess fit of p<sub>1</sub> to large-scale network settings?
- Linking algebraic statistics for loglinear models to results for p1.
- Extending results from p<sub>1</sub> to Exponential Random Graph Models.
- Algebraic statistics for mixed-membership stochastic block models.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Why reparametrize?, redundancy, symmetry

- ▶ Fienberg-Wasserman: p<sub>1</sub> model is a n<sup>2</sup> × 2 × 2 contingency table (n<sup>2</sup> dyads, 2 × 2 configurations)
- ▶ Highly redundant! Undesirable for finding Markov bases: 4n<sup>2</sup> indeterminates instead of 2n(n − 1). (OK for MLE.)
- Number of generators explodes combinatorially: for the case of constant reciprocation,  $\rho_{ij} = \rho$ , the ideal of the network on n = 3 nodes has 107 minimal generators, and the one of the 4-node network has 80, 610.
- Non-applicable Markov basis elements; symmetries
- We were able to analyze the n = 4 case and reduce all of the 80,610 moves to the ones we get using our design matrices, but the effort was nontrivial.
- Therefore, at least from the point of view of studying Markov bases, the parametrization we are using is preferable.

# Revealing "simple" moves

The following degree-five binomial appears as a minimal generator of the ideal of a 4-node network:

 $p_{li}(1,0)p_{ij}(1,0)p_{jk}(1,0)p_{lj}(0,0)p_{ik}(0,0)-$ 

 $p_{li}(0,0)p_{ij}(0,1)p_{jk}(0,0)p_{lj}(1,0)p_{ik}(1,0)$ 

This move can be obtained by the following sequence of simple moves:

replace the edges (I,i) and (j,k) by the edges (I,k) and (j,i) followed by

replace the edges (i,j) and (l,k) by the edges (i,k) and (l,j)..

Figure: A sequence of two moves on 4 nodes: dashed edges are replaced by full edges.

## Simple moves

In fact, for n = 3, 4, 5, we can get all Markov moves in our list as decompositions of these simpler moves!

Figure: An essential, simple move

Bidirected edges appear in this same pattern in all Markov moves. These are generators of Q<sub>n</sub> from Theorem 2.

## Next?

- Prove the "homogenization" claim in terms of generators!
- Prove the decomposition to simple moves, even though they are not in the toric ideal as defined.
- This decomposition would identify precisely the Markov moves in this setting with moves of Holland-Leinhardt in some cases.

#### Thank you for your attention!
